Living Things and Food

All living things need food.
Plants need food to grow.
Animals need it to grow and move.
Some animals need to eat
almost all the time.

Living things are also food
for other living things.
This is why people say
they are part of a food chain.
A food chain shows who eats what.

Links in the Chain

Plants and animals link up
in food chains.
The sun helps the plant
make its food.
This is why the chain
starts with the sun.
Then, the rabbit eats the grass,
and the dingo eats the rabbit.
An arrow goes
from a plant or an animal
to the animal that eats it.

Plants and Food

Plants are part of a food chain.
They do not move about.
This is why they need
to make their own food.
Plants make food in their leaves
with sunlight, rain, and air
all the time.

The food helps plants grow taller
and, at times,
grow flowers and fruit.
