How Animals Move Around

by Zita and Aurora Hilvert-Bruce

For teachers' inspection ONLY

Introduction

Animals move in many ways because they have different shapes.

Horses have long legs to gallop over land.

Fish have fins to swim through the water.

Birds have wings to fly through the air.

For teachers' inspection ONLY

Many animals move
in more than one kind of way.

Some seals use their flippers
to move over land,
and to swim through water.

Ducks can fly through the air,
or walk on land.
They can also swim and dive.

Moving on land

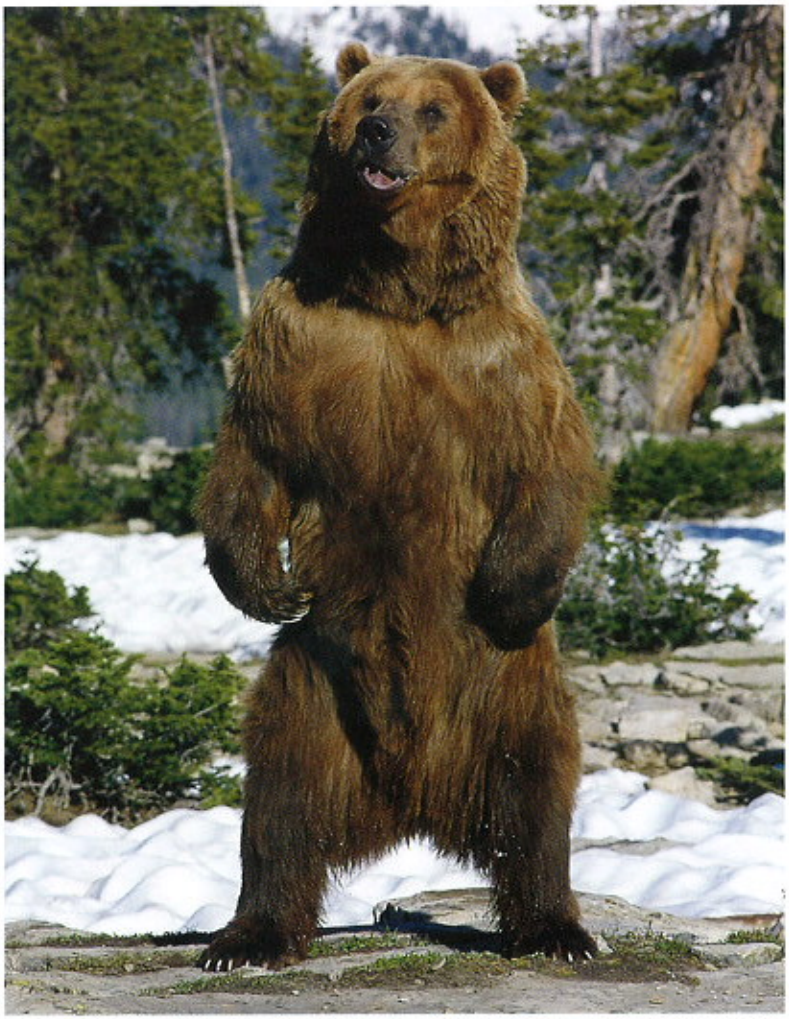

Many animals that live on land have four legs.
They use all their legs to lift their bodies off the ground.
This makes it easy for them to walk and run.

Some animals have four legs, but stand on only two of them.

Sometimes bears walk on their back legs. They don't always need to use four legs.

For teachers' inspection ONLY

Kangaroos have powerful back legs and feet for hopping.
They use their tails
to help them balance as they hop.
